Functionality, performance, and other benefits of this feature may vary depending on system configuration. Learn More However, over the last year or so it seems that ECS has worked hard on improving its image with a new range of highend motherboards. As such it supports DDR2 and PCI Express, with two slots of the former, a single x16 PCI Express for graphics and two x1 PCI Express slots for peripherals. There are also a further two PCI slots for your peripherals. A downside though for anyone upgrading an older PC, is that there is only one IDE connector supporting two drives.

This is a limitation of the 915P chipset, but you do get four SATA connectors in exchange. It would have been good though if ECS had provided a SATA to EIDE converter for upgraders. The 915PA only features the plain ICH6 rather than the RAID enabled version. Moving to PCI Express normally means dumping your AGP card and switching to DDR2. However, thanks to AGP Express and the DDR sockets ECS is proving a cost effective upgrade path. If you're desperate to upgrade your computer, but can't afford to get all the components at once, then this might be a suitable option for you. Essentially, the bandwidth of two PCI slots have been fused together to create an AGP compatible interface. However, this still doesn't quite match the performance of a proper AGP implementation. However, this feature was not frequently employed by applications so is unlikely to be missed. Nevertheless, as you'll see from the benchmarks, AGP Express proved to be less than ideal for 3D applications. Using the PCI bus rather than the PCI Express bus means lower performance and higher CPU usage, not to mention potentially affecting the bandwidth available to the AGP Express slot, as all PCI devices shares the same bus. All of the rear ports can be reconfigured for various output and input options by using the supplied software application. There are a further two headers that would provide another four USB 2.0 ports so omitting the bracket ports seems quite stingy. By contrast, Biostar managed to supply at least one bracket with its budget boards. Even more disappointing is that you only get a single SATA cable and a single SATA power adapter. This means that you'd have to buy an additional three cables if you wanted to take advantage of all the SATA connectors in the future. Board layout is reasonably tidy and there are three spare fan connectors, not counting the four pin CPU fan connector.

The only minor complaint is that to change the memory you would have to remove any PCI Express graphics card first. According to the technician at ECS I spoke with, this might be resolved in a future BIOS update, but currently you have to use ATI cards. Again, I didn't have a one hundred per cent success rate with all the ATI cards I tried, but the chance that it will work is much greater. However, swapping the Radeon 7500 for a Radeon 9250 or Radeon 9550 was a failure. I could boot into Windows, which I couldn't do with the nVidia cards, but neither of the 9000 cards were

recognised in conjunction with a PCI Express card. The implementation could do with some further tuning, but as an inexpensive path to a quad display solution it has plenty of potential. To remove as many bottlenecks as possible the tests were run using a 3.6GHz Socket775 Pentium 4 processor, a 250GB Maxtor SATA hard drive, 1GB of PC4300 DDR2 memory, and in another test with 1GB of PC3200 DDR memory. For comparing the graphics performance a PCI Express and an AGP GeForce 6600GT card were used. In SYSMark 2004 the overall score using DDR1 memory and the AGP Express slot produced a score of 209. Swapping the graphics card for the PCI Express solution upped the score to 211, while changing the memory to DDR2 again increased the score to 214. Starting again with the AGP Express setup, the 3DMark05 score is a very low 1419. With the PCI Express card however, the score went up to 3556 and swapping the memory over to DDR2 brought it up further to 3563. The advantage of DDR2 memory over DDR is fairly minor, although some will take the opportunity to grab any performance increase, no matter how small. However, for most, the extra cost doesn't justify running out to get DDR2 straight away. But considering the mixed impressions I've had from this board I can't recommend it for everyone.

However, as a cost-effective upgrade solution or if you need a cheap quad display setup, there are few other options out there though its hardware compatibility issues should be taken into account. Regards Martin I think the route to go is to check what other systems are using this board and pick the highest rated CPU from that list. I will post if I manage to get anymore information, Im not beaten yet and I know others will at some point be searching and going round in the same circles so I want to try and solve this one. It is possible to install the third fan and, thus, enhance the forcedair cooling. Eventually propellers intersperse with heatsink assemblies to form the final framework. The novelty features six copper heat pipes 6 mm in diameter, being directly connected to the CPU cover. The Continuous Direct Contact 2.0 CDC 2.0 technology is applied, improving the efficiency of heat dissipation. The ultimate noise level equals 31 dBA, and the average time to failure declared is 160,000 hours. In this light, practically every company that specializes on computer hardware tries to replenish its line of chassis with an item of unusual design and prominent technical characteristics. In the majority of cases, such products belong to the highend category and cost pretty penny.

Thermaltake chassis collection boasts a line of highend products, among which is Level 10 GT

model. This model is characterized by refined and stylish design, as well as, multiple facilities pertained to layout and performance. Design Chassis Thermaltake Level 10 GT is developed in FullTower formfactor and goes with 582x282x590 dimensions. The casing has got external section divisions which are realized by means of the overhung details and different coloring. The novelty, available in a black and white version, weighs 890 g, has the dimensions of 128 138 135 mm and the 135 W TDP rate. CR301 is built on the twosection heatsink with fins perpendicular to the base. The contact plate and 6 mm heat pipes are made of copper, and the radiator is manufactured out of aluminium. Speaking about fans we should note, they are mounted on the heatsink pieces through the use of screws. On top of everything, fans are backlighted.
