You'll also need to install the Device Management System client application on at least one computer that's running the SteamVR software. Submit a request. For the long-term archiving of digital media, see Digital preservation. Most are capable of keeping a record of the various versions created and modified by different users history tracking. In the case of the management of digital documents such systems are based on computer programs. The term has some overlap with the concepts of content management systems. It is often viewed as a component of enterprise content management ECM systems and related to digital asset management, document imaging, workflow systems and records management systems. These systems dealt with paper documents, which included not only printed and published documents, but also photographs, prints, etc. The earliest electronic document management EDM systems managed either proprietary file types, or a limited number of file formats. EDM systems evolved to a point where systems could manage any type of file format that could be stored on the network. The applications grew to encompass electronic documents, collaboration tools, security, workflow, and auditing capabilities. However, once content is imported, the software acts like a search engine so users can find what they are looking for faster. Here is a description of these components Metadata may, for example, include the date the document will be stored and the identity of the user storing it. The DMS may also extract metadata from the document automatically or prompt the user to add metadata. Some systems also use optical character recognition on scanned images, or perform text extraction on electronic documents. The resulting extracted text can be used to assist users in locating documents by identifying probable keywords or providing for full text search capability, or can be used on its own. http://globalvcc.com/_UploadFile/Images/canon-powershot-s70-manual-pdf.xml

Optical character recognition OCR software is often used, whether integrated into the hardware or as standalone software, in order to convert digital images into machine readable text. Optical mark recognition OMR software is sometimes used to extract values of checkboxes or bubbles. Indexing may be as simple as keeping track of unique document identifiers; but often it takes a more complex form, providing classification through the documents metadata or even through word indexes extracted from the documents contents. Indexing exists mainly to support information query and retrieval. Storage of the documents often includes management of those same documents; where they are stored, for how long, migration of the documents from one storage media to another hierarchical storage management and eventual document destruction. Although the notion of retrieving a particular document is simple, retrieval in the electronic context can be quite complex and powerful. This would typically return a list of documents which match the users search terms. Some systems provide the capability to specify a Boolean expression containing multiple keywords or example phrases expected to exist within the documents contents. See also Document retrieval. An original master copy of the document is usually never used for distribution; rather, an electronic link to the document itself is more common. Compliance requirements for certain documents can be quite complex depending on the type of documents. Document marking at the time of printing or PDF creation is an essential element to preclude alteration or unintended use. Usage depends on the

environment to which the electronic document management system EDMS is applied. Manual workflow requires a user to view the document and decide whom to send it to. <http://www.valuationsolutions.co.nz/canon-powershot-s5is-user-manual.xml>

Rulesbased workflow allows an administrator to create a rule that dictates the flow of the document through an organization for instance, an invoice passes through an approval process and then is routed to the accounts payable department. Dynamic rules allow for branches to be created in a workflow process. A simple example would be to enter an invoice amount and if the amount is lower than a certain set amount, it follows different routes through the organization. Advanced workflow mechanisms can manipulate content or signal external processes while these rules are in effect. Access should be blocked to other users while work is being performed on the document. Other advanced forms of collaboration act in real time, allowing multiple users to view and modify or markup documents at the same time. The resulting document is comprehensive, including all users additions. Documents can be searched using various attributes and document content. Those steps ensure prudence and logical thinking. Any careless handling may result in the inaccuracy of the document and therefore mislead or upset its users and readers. In law regulated industries, some of the procedures have to be completed as evidenced by their corresponding signatures and the dates on which the document was signed. Following is a list of some of the relevant ISO documents. Some industries work under stricter document control requirements due to the type of information they retain for privacy, warranty, or other highly regulated purposes. Examples include Protected Health Information PHI as required by HIPAA or construction project documents required for warranty periods. Failing to comply can cause fines, the loss of business, or damage to a business reputation. In this context documents are any of a myriad of information assets including images, office documents, graphics, and drawings as well as the new electronic objects such as Web pages, email, instant messages, and video.

However, paper can be costly and, if used excessively, wasteful. Document management software is not simply a tool but it lets a user manage access, track and edit information stored.
