Car seats and strollers can be overwhelming, we get that, so don't hesitate to reach out. If you don't see your question below, or the words just aren't clicking in this moment, we have videos walking through different steps and parts of our products on YouTube here. Infant and Convertible Car Seats Installation What do I do with my car seat after a crash Can I add a head insert My child is six years old. Aren't seat belts sufficient Is it safe for him to ride in the front seat How do I reset it With your weakest hand at the belt path, tilt and push the car seat forward and back and from side to side. The vehicle belt or LATCH belt used to secure the car seat should not loosen during this test. Get your seat checked over by a CPST in your area to confirm it is installed properly. Schedule an appointment with our Consumer Care team to guide you through the installation process!

The LATCH system can only be used in vehicles that have the LATCH anchor bars installed and designated LATCH seating positions. Most vehicles manufactured after September 2002 are equipped with LATCH. Check your vehicle owner's manual to see which seating positions are with the LATCH system. These anchor bars cannot be retrofitted into the vehicle. Refer to your vehicle owner's manual to see which seating positions may be equipped with the LATCH system. The car seat is used with the LATCH system the same way as it is with the vehicle seat belt. The LATCH system does not, for example, allow an infant to be placed rearfacing in the front passenger seat with an active airbag. Please refer to your instruction manual for specific installation instructions. However, your child restraint must be tightly locked in place at all times. To determine if your vehicle's belts are compatible with your car seat, check your vehicle owner's manual section on vehicle seat belt use with child restraints. If the vehicle lap and shoulder belts are attached, thread both through the belt path. Buckle the vehicle belt and adjust as tightly as possible by pushing down firmly on the seat while pulling up on the shoulder belt until the lap belt is tight. It is not necessary to make the seat completely immobile, but it should not move more than an inch or two from side to side. This changes the performance of a car seat and may be dangerous. Use one method or the other. In certain situations, you get a better fit without the base. For example, if your vehicle seats are very narrow or if you are using the seat for airline travel, you may find that you get a more secure fit by installing the seat without the base. Use on forwardfacing aircraft seats only and in a

position where the lap belt can be tightened securely. It is always advisable to contact the airline prior to taking a car seat on board.

Before making the switch, consult your local laws and talk to your pediatrician if it's time to make the move from rearfacing to forwardfacing. Verify with both your vehicle manual and your car seat manual. The tether can greatly improve the performance of a forwardfacing car seat and is only used for the forwardfacing toddler position. We strongly recommend that you use the tether in the forwardfacing position, whether you have installed your car seat with LATCH or with the vehicle seat belts. Loosely attach the tether to the designated vehicle anchor Consult vehicle's owner manual for specific location before threading the vehicle belt through the belt path on the child restraint. After installing your car seat securely, pull tether strap tight so there is no slack. This ensures that the lower part of the harness is snug. Then, using the adjuster that comes with your car seat, remove all slack until the entire harness is snug. In general, thread the crotch strap through the slot closest to your child's body, but not underneath your child. Check your instruction manual, as some models may use only the rear two slots for rearfacing infant mode. If the harness is above the baby's shoulders with the straps in the lowest position, do not use the car seat until the baby grows into it. For a child who is in the forwardfacing position, the straps must be even with or just above the child's shoulders. Every seat is different. Our testing has shown that the resulting angle leads to the best crash test performance, even for older and larger children, for car seats that have level line indicators. If your vehicle seat is deeply sloped, you may need to place a rolled towel or foam noodle on the vehicle seat, where the vehicle seat cushion meets the vehicle seat back, so that the level line on the side of shell is level to the ground.

For deeply sloped vehicle seats, this solution is common to most car seats on the market and is recommended by the National Highway Traffic Safety Administration NHTSA. Check often to be sure padding is still in place and the vehicle belt is tight. Wipe plastic, vinyl, and metal parts with a damp sponge or cloth. The harness system should be cleaned with mild soap and water. Wipe the outside of the buckle with a damp cloth. Do not lubricate the buckle or immerse in water. Do not use bleach or harsh chemicals on your car seat and do not dry clean. Use of cleaning agents such as these can damage your car seat and cause deterioration of the materials. You'll be required to make a down payment and subsequent installment payments. Expiration dates may vary. Car seats past their expiration date are no longer approved for use. Older car seats don't have the newer technologies we've developed, and expiration dates ensure the seats you're using are the best they can be. In addition, car seats are used almost every day, so after a while the materials can wear down and not perform at the top of their game. Depending on the severity of the crash, the internal structure might be damaged in ways that aren't obviously visible. If the crash is enough to damage the structure of your car it stands to reason that the same force would have an impact on the plastic of your child's car seat. Always call your insurance after any accident. What do I do with my car seat after a crash If you want to recycle the seat yourself, there's a few steps you'll have to follow. First, remove all the fabric, padding, harness straps, and metal from the plastic seat. Check your vehicle owner's manual for specific information on installing a child restraint in the selected seating position. If a locking mode is not available for that seating position, move the car seat to a different position or consult your car seat instructions for information on locking clips or available "belt lock off plates.

" Can I add a head insert This padding is designed for and tested with the specific car seat model and harness system. Additional padding may not be placed under your child or under the car seat's harnesses. Lock the latch plate into buckle until you hear a "click." Pull up on the crotch strap to make sure the buckle is locked. If you cannot get the harness to adjust and remain tight with the buckle securely locked, do not use the car seat. Contact Consumer Relations at 800 9514113 This includes major forwardfacing crash testing requirements. But that is just the beginning. Our car

seats are designed to protect during severe side impact crashes, those with vehicle intrusion. In those crashes, the car seat, and child occupant are struck by unbelievable forces. Forces that crumple the door and ram the steel structure into the interior of the car and into the occupant. Simulating that type of severe crash is an innovation in itself, allowing car seat engineers to develop lifesaving systems like Air Protect. Side impact crashes are one of the most threatening for children, accounting for more than 30% of child crash fatalities. Air Protect helps to divert crash energy away from the child, releasing air on impact to immediately reducing impact forces. Pure Cosi fabric is woolfree and flameretardant chemical free. Pure Cosi is available in the Mico Max Plus Infant Car Seat and the Magellan Max 5in1 Convertible Car Seat. The top of a child's head cannot exceed the top of the TinyFit insert. The main headrest which uses the PerfectFit, norethread harness system has the following shoulder heights about 10" at the lowest, 11", 12", 13", 14", 15", 16", 17" and just under 18" at the highest. The top of the headrest is about 7.5" from the top of the harness shoulder position. The middle of a child's head cannot exceed the top of the headrest when used forwardfacing. The shape of the seat and fabric padding can create variations in the measuring process.

The above measurements should be a good guide, but you may find some variation as you take your own measurements. Give them a call at 800 9514113 My child is six years old. Aren't seat belts sufficient The lap belt should fit flat across a child's upper thighs not across the soft abdomen, which is more likely to be injured in a crash than bony structures like the pelvis. The shoulder belt should cross snugly over the chest and the middle of a child's shoulder. This positions the vehicle seat belt to be effective in a crash and make the child more comfortable. Also, some states have laws specifically regarding booster seats so make sure you're following those regulations. Also, some states have laws specifically regarding booster seats so make sure you're following those regulations. Is it safe for him to ride in the front seat Check with your pediatrician and your local laws to determine when is the right time for your child to ride in the front seat. It should not be used as a carrycot. The rest of the fabric is not removable this needs to be washed with water, soap and a sponge. The front seat must be forwardfacing, but the rear seat can either face you or the world. The Lara is not compatible for use with an infant seat, so it cannot be used before then. Visit our blog for more details and instructional videos on opening your MaxiCosi stroller. View our stepbystep instructions and videos to master folding your MaxiCosi stroller.
