It is assumed that these personnel are familiar with the servicing procedures of these products, or like or similar products manufactured and marketed by Mercury Marine, that they have been trained in the recommended servicing procedures of these prod ucts which includes the use of mechanics' common hand tools and the special Mercury Marine or recom mended tools from other suppliers. We have not under taken any such wide evaluation. All information, illustrations and specifications con tained in this manual are based on the latest product informa tion available at the time of publication. It should be kept in mind, while working on the prod uct, that the electrical system and ignition system are capable of violent and damaging short circuits or se vere electrical shocks. When performing any work where electrical terminals could possibly be grounded or touched by the mechanic, the battery cables should be disconnected at the battery. Any time the intake or exhaust openings are exposed during service they should be covered to protect against accidental entrance of foreign material which could enter the cylinders and cause extensive inter nal damage when the engine is started.

It is important to note, during any maintenance proce dure replacement fasteners must have the

same measurements and strength as those removed. Numbers on the heads of the metric bolts and on the surfaces of metric nuts indicate their strength. American bolts use radial lines for this purpose, while most American nuts do not have strength markings. Mismatched or incorrect fasteners can result in damage or malfunction, or possibly personal injury. Therefore, fasteners removed should be saved for reuse in the same locations whenever possible. Where the fasteners are not satisfactory for reuse, care should be taken to select a replacement that matches the original. This is considered standard shop practice even if not specifically stated. Whenever components are removed for service, they should be retained in order. At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed. Before raising or removing an outboard engine from a boat, the following precautions should be adhered to:

1. Check that flywheel is secured to end of crank shaft with a locknut and lifting eye is threaded into flywheel a minimum of 5 turns.
2. Connect a hoist of suitable strength to the lifting eye.

In addition, personnel should not work on or under an outboard which is suspended. Outboards should be attached to work stands, or lowered to ground as soon as possible. We reserve the right to make changes to this manual without prior notification. Refer to dealer service bulletins for other pertinent information concerning the products described in this manual. These can then be sold over eBay. However, remember that you are only stripping away the parts that you are able to. However, many are able to turn a tidy profit by starting with the simplest of parts. If these simply drain out of the car into the ground they can cause great damage to the local environment, including the water table. While many junkyards are careful to provide protection against this, not all are. In a junkyard, it is mainly the main engine parts that will be in demand.

It this was performed globally, the need for mining and damaging the environment would be considerably reduced. Experts expect that precious metals will become more valuable in the future.
